

Strategic Intraday Trading: ORB, Gap-Up Short, and LEG Execution Framework

Intraday Trading Architecture

Systematic execution for Gap-Up Shorts, ORB, and LEG strategies.

#PRICEACTION

#RISKMANAGED

● Gap-Up Short 3% + Opening Gap ✓ Timeframe: 1-Minute (Exclusive) ✓ Entry: 2/3 Candle body breakout ✓ Target: Gap-filling level	● Standard ORB 3m Primary TF ✓ Logic: 1st Support/Resistance ✓ Range: Wait for opposite color candle ✓ Filter: Avoid if far from 10/20 EMA	● LEG Strategy 2nd Wave Entry ✓ Setup: Missed 1st leg movement ✓ Trigger: Marubozu bounce from EMA ✓ Limit: Avoid after 3-4 legs (Exhaustion)
---	--	---

EXECUTION CHECKLIST

Decisive Breakout: Min 50-66% body close

EMA Alignment: 10 EMA (Fast) / 20 EMA (Slow)

Stop Loss: Swing High/Low of opposite candle

RISK PARAMETERS

Max Stop Loss:1.5%

Target Ratio:1:2+

Late Entry (1 PM):1:1 Only

This comprehensive training session outlines professional intraday trading methodologies focusing on the Opening Range Breakout (ORB) and LEG strategies. It provides specific execution rules for gap-up scenarios and emphasizes the integration of Exponential Moving Averages (EMA) to optimize entry timing and risk-reward ratios.

1. Opening Range Breakout (ORB) Fundamentals

The ORB serves as the foundational execution method for identifying trading opportunities as the market opens. The "Opening Range" is defined by marking the high and low points of the price action from the first candle of the day until an opposite-colored candle is formed. This range represents the day's initial support and resistance levels. Traders should wait for a "decisive breakout"—where at least 50% to two-thirds of a candle's body closes outside the range—to confirm that either buyers or sellers have taken control. For standard intraday trades, a 3-minute timeframe is recommended, while a 1-minute timeframe is reserved specifically for gap-up short strategies [00:00-03:3608:57-12:3918:05](#).

ORB Execution Matrix		
Trade Type	Timeframe	Confirmation

Gap-Up Short	1-Minute	Breakdown below Low
Standard Intraday	3-Minute	Decisive Body Close
Late Morning	5-Minute	EMA Retracement

2. The Gap-Up Short Strategy

This specialized strategy targets stocks opening with a significant gap, typically around 3% or higher. Using a 1-minute timeframe, traders establish the ORB and look for a breakdown. The primary objective is to capture the "gap-filling" move. Stop losses are placed at the high of the opposite-colored candle within the range (the swing high). If the ORB is too wide or the initial move is missed, "Trend Logic" can be applied: entering a short position as soon as the low of a green retracement candle is broken, which often provides a superior risk-reward ratio compared to a late ORB entry [13:52-18:0520:25-23:5728:05-31:37](#).

3. LEG Strategy and EMA Mean Reversion

The LEG strategy is designed for traders who miss the initial market move. It focuses on participating in the "second" or "third" leg of a trend. Rather than chasing a price that is far from the 10 or 20 Exponential Moving Average (EMA), traders must wait for a retracement or consolidation near the EMA line. A valid entry is triggered when a Marubozu candle (a candle with a strong body and minimal wicks) bounces from the EMA in the direction of the prior trend. This approach ensures that the trade is backed by momentum while maintaining a tight stop loss just beyond the consolidation zone [47:38-51:3101:11:10-01:17:4501:24:35](#).

LEG Strategy Workflow

- 1. Identify Prior Trend:** Ensure the stock has a clear directional move (Leg 1).
- 2. Wait for Mean Reversion:** Price must return to or consolidate near the 10/20 EMA.
- 3. Signal Candle:** Look for a **Marubozu** or strength candle bouncing off the EMA.
- 4. Entry:** Execute on candle close with SL at the recent swing high/low.

4. Stock Selection and Advanced Price Action

Effective trading requires filtering the universe of stocks to find those with high momentum. Traders are advised to use the "Intraday Boost" (IB) and "High Powered" (HP) sections of the Trade Code platform, focusing on the top 4-5 stocks by volume and R-factor. Advanced price action involves being flexible in the live market—for instance, avoiding a breakout if there is a strong rejection wick, even if the theory suggests an entry. Successful execution relies on combining these data-backed filters with visual confirmation of candlestick strength [40:3352:5401:04:31-01:08:2101:46:46](#).

Key Data & Criteria

- **Gap-Up Threshold:** Approximately 3% or above for shorting opportunities [15:11](#).
 - **Decisive Breakout:** Minimum 50% to 66% (two-thirds) of the candle body must close outside the opening range [18:05](#).
 - **Stop Loss Limit:** Generally maintained within 1.5% of the entry price for intraday trades [55:23](#).
 - **Timeframe Shift:** Switch from 3-minute to 5-minute charts for entries after 11:30 AM or 12:00 PM [01:27:0001:29:56](#).
-

To-Do / Next Steps

- **Pre-Market Screening:** Filter F&O stocks in the pre-market session to identify those with gaps near 3% [31:37](#).
 - **Volume Filtering:** Focus on the first 4-5 stocks in the Intraday Boost list sorted by volume factor [40:33](#).
 - **EMA Setup:** Configure charts with both 10 and 20 EMA to identify overextended prices [46:36](#).
 - **Timeframe Management:** Ensure the 1-minute timeframe is strictly used for gap-up shorts and 3-minute for all other ORB setups [39:15](#).
 - **Profit Booking:** Target the gap-filling level for short trades and look for reversal signs like bullish pin bars to exit [22:5025:18](#).
 - **Review Schedule:** Attend the Module 2 session tomorrow to cover daily contraction setups and risk management [01:41:31](#).
-

Conclusion

Intraday success is predicated on discipline and waiting for high-probability setups where price action aligns with EMA support. By utilizing the ORB for early volatility and the LEG strategy for trend continuation, traders can systematically approach the market while minimizing the risks associated with chasing "extended" prices. Always prioritize stocks backed by volume and R-factor data to ensure sufficient liquidity and momentum for the strategies to resolve profitably. [01:43:0101:52:23-01:56:24](#)
