

Trade Code Mastery: Navigating Live Market Data and Institutional Flow

Trade Code Mastery: Intraday Workflow

A comprehensive guide to tracking smart money and executing data-driven trades.

MODULE 1-3

01. PRE-MARKET

9:00 - 9:15 AM

- Focus on **FO Stocks**
- Filter by **Volume Factor**
- Identify Gap Up/Down
- Build initial watch list

02. MARKET OPEN

Intraday Boost

- Monitor **R-Factor**
- High Powered Stocks
- ORB & Leg Strategies
- Sectorial Flow alignment

03. MOMENTUM

Spikes & Spans

- 5-min **Momentum Spikes**
- Multi-Resistance BO
- Upside/Downside LoM
- Scalping opportunities

04. ADVANCED

OI & Analysis

- Open Interest (OI) Data
- Put-Call Ratio (PCR)
- Long/Short Build-ups
- Swing Center breakouts

THE R-FACTOR COMPONENTS

Volume Surge

Open Interest

Pivot Points

RSI/MFI/ADX

Price Action

Core Principle: Trade Code is a *Buffet*, not a signal provider. It highlights activity; your final decision must be based on **Price Action**.

PRO TIPS

 **Risk Management:** Don't chase momentum if stop-loss is too wide.

 **Timeframes:** Switch to 5-min after 11:30 AM; use 3-min for morning volatility.

#TradingStrategy #SmartMoney #IntradayTips

Estimated Session Length: 78 mins • Target: Intraday Traders

This session, led by Prashant, serves as an introductory guide to the **Trade Code** software, focusing on the transition from theoretical knowledge to live market execution. The core objective is to empower traders to follow "Smart Money" by utilizing real-time data analytics rather than lagging end-of-day reports.

Detailed Summary

1. Analysis of Recent Trade Executions

The session opened with a retrospective on recent trades in **Syngene** and **Coal India**. Prashant emphasized that while both trades initially provided favorable risk-reward ratios

(exceeding 1:2), they eventually hit stop-losses due to strong momentum shifts and a decision to wait for higher targets. A key takeaway for participants was the limitation of "theoretical perfection" in live markets; for instance, entries were made based on strength (bullish pin bars) rather than waiting for a perfect Marubozu candle. The discussion highlighted that risk management and staying within predefined risk limits are more critical than the outcome of any single trade [04:28-12:37](#).

2. The Philosophy of "Smart Money" and Live Data

The fundamental necessity of a tool like Trade Code is the ability to track **Institutional Investors (DIIs and FIIs)**. Since retail traders lack the capital to initiate market trends, they must follow the "Smart Money" that creates demand and supply. Prashant argued that end-of-day data is often useless for intraday traders because the rally has already concluded. Trade Code solves this by providing live data—albeit with a 1-2 minute exchange delay—allowing traders to participate in active price movements rather than analyzing them post-mortem [15:08-22:43](#).

The R-Factor: Multi-Dimensional Data

The **R-Factor** is a proprietary relative value that aggregates four critical data streams to identify high-activity stocks:

- **Volume:** Sudden surges compared to historical averages.
- **Open Interest (OI):** Buildup in both Futures and Options.
- **Price Action:** Proximity to Supports, Resistances, and Pivot Points.
- **Technical Indicators:** Real-time RSI (Strength), MFI (Volume-weighted RSI), and ADX (Trend Intensity).

3. Operationalizing the Trade Code Interface

The workflow for a trading day is structured into specific phases:

- **Pre-Market (9:00 - 9:15 AM):** Traders should focus on the "Volume Factor" rather than just percentage gainers. This identifies stocks with unusual activity relative to previous sessions. It is recommended to filter for **F&O stocks** to ensure liquidity [24:45-34:31](#).
- **Market Depth (Intraday Boost & High Powered):** These sections rank stocks by their R-Factor. High Powered stocks are significant because they are major contributors to sectoral indices. Traders are advised to monitor the top 4-5 stocks that align with their comfort level [34:32-41:19](#).
- **Momentum & Breakouts:** The **Momentum Spike** section identifies sudden volume bursts, often ideal for "Leg Strategies." Meanwhile, **Multi-Resistance/Support Breakouts** track stocks crossing 2-day highs or lows [43:21-47:32](#).

4. Sectoral Alignment and Index Analysis

For advanced traders, the **Sectoral Flow** tool helps determine if a stock's movement is supported by its broader industry. Prashant noted that beginners should trade in the direction of both the index and the sector, while experienced traders may rely solely on price

action. Additionally, the **Index Analysis** module allows for the study of Call and Put writing (Open Interest), where heavy Call writing indicates bearishness and Put writing indicates bullishness [47:32-55:51](#).

Key Data

- **Data Delay:** Standard 1-2 minute delay from NSE/Brokers to third-party tools [20:34](#).
- **Market Coverage:** Focus on the **188 F&O stocks** for wider selection and liquidity [32:27](#).
- **Pre-Market Window:** Critical updates occur between **9:09 AM and 9:10 AM** [32:27](#).
- **R-Factor Composition:** Includes Volume, OI, Support/Resistance, RSI, MFI, and ADX [36:47-39:07](#).

To-Do / Next Steps

- **Daily Routine:** Start the trading day by checking the Pre-Market section at exactly 9:09 AM. [32:27](#)
- **Watchlist Management:** Select the top 4-5 stocks from the Intraday Boost or High Powered sections based on the highest R-Factor. [35:42](#)
- **Skill Development:** Attend the upcoming Saturday session to learn specific entry/exit strategies like ORB and Leg Strategy. [22:4333:31](#)
- **Technical Setup:** Contact Trade Code support if the Index Analysis module is not visible on your dashboard. [01:01:23](#)
- **Educational Review:** Repeat the Module 1 session if the concepts of R-Factor or OI data remain unclear. [58:38](#)

Conclusion

Trade Code is designed to be a "buffet" of high-activity opportunities, but the final decision to trade must always be governed by **Price Action**. By focusing on the R-Factor and sectoral alignment, traders can filter out market noise and align themselves with institutional movements for more consistent intraday performance.
